As per our earlier PMs (for the benefit of everyone here), i've completed my 1.3.1 testing. All of the parts are functional. I utterly failed to build anything worth showing off though.. Though this is not due to a lack of skill, so much as a lack of parts. The bottom line is that KAX simply does not have enough parts. However, as i said, what is here, works just fine.

As an aside, i don't know what the original mod author was thinking... ALL of the engines are woefully under-powered. I'd built a 4-engine plane, reminiscent of an old airliner, or WWII bomber... however, i couldn't keep it in the air, because the turboprop engines (the strongest engines in the pack) were still far too weak to be truly useful for the application.

The parts of KAX that I love most is the cockpit and the engines. The vintage propellers have a huge potential, but they need companion parts.

And I really need to make that gorgeous gears to work again!

I agree, the landing gear were awesome-looking, and were actually one of the original reasons i got the mod.... unfortunately, i never got to use them. I think they'd already been removed by the time i first downloaded the mod. the cockpit module, and electric motors were pretty decent though. However, the electric motor (much like all the rest of the engines) is still very much under-powered.

At least for KSP 1.7 downto 1.4, with the engine module of that era, nope. The thrust of the engines are more or less related to real life.

I already had discussed this previously:

TLDR: You can simply convert the engine HP into KN . The piston engine is way different from jets, and at least for KSP 1.4 to 1.7.3, what KAX have is more or less realistic.

It's insane having a small turboprop (as from another add'on) to have the same thrust of a Cessna Citation engine!

I have no information yet about KSP 1.8

It is not on [CKAN](#) yet, there are a few adjustments I need to do first

I see, thanks for clarification. `.version` links to `master/KAX.version`, which is updated, so AVC tell, that there is a new version.

Also github have prerelease checkbox, which could help understand at once that nothing is forgotten.

Sir, I own you an apology. **You are right, I forgot to update SpaceDock.** Sorry.

In my defense, I'm awake for more than 18 hours and worked the whole day, partially business, partially detecting problems on TweakScale, and I'm really wasted. I will update SpaceDock by the morning, as as you can see,

it will be probably not the best of ideas to update things at this moment. 🤖

@Lisias, looks like you forgot to add 2.8.0.2 to spacedock, so it isn't on [CKAN](#)

I just updated SpaceDock with the 2.8.0.2, following your heads up. Thanks, and sorry for the misunderstanding.

Looks like it is time to get at least one day off before another bug hunting quest over TS and KSP 🤖. @Lisias, don't overburn yourself with all mods that you maintain. Take your own pace with this and might even a bit slower than your own pace 🤖 as it seems to be too much of those unwanted events lately.

With the latest release of [Firespitter \(7.14\)](#), where the FX emitters were commented out to allow the thing to work on KSP 1.8 as fast as possible, I could give KAX a try on it.

There're changes on the Physics engine as we can see on the overstressed wings, and I don't know yet how the new Engines Modules are behaving (I have more thrust? Less? Drag?), but at least this insane bomber of mine took off.

The overall performance is better, no doubt. I'm running this on the very same old Mac Potato I'm using since last year, and things are smoother. I think the gears are behaving a bit different - I'm not sure, but I think this gears are working better, at least for this use case.

Further testings only on the Week End for obvious reasons.

KAX v2.8.0.2

KSPe.Light.KAX v2.1.0.16

[WRN 06:35:05.604] 1 warning

related to

GameData/KAX/Patches/KAX_FAR.cfg

Usually full logs are needed, otherwise I would had to try to reproduce it myself - that takes time. Full logs allows me to respond almost instantly most of the times, while having to reproduce the thing needs to be done as time allows, what sometimes can take a huge amount of time (there're tickets on TweakScale aging for months, as I just can't spare the time to reproduce the problem).

And since my own gaming installation doesn't issue this warning, I'm on the dark, Please publish a **full** KSP.log (with even Module Manager's messages, so I don't have to ask for new files, neither had to merge them to be processed

on my tools).

somehow I thought that it is some kind of typo in that file and WRN quote will be enough, but there it is

Sometimes it is, but sometimes it's not. And the KSP.log provides a detailed error message for the problem, as in this case:

```
[WRN 10:11:15.404] more than one pass
specifier detected, ignoring all but
the first:
KAX/Patches/KAX_FAR/@PART[KAXVintage*]:
AFTER[FerramAerospaceRe
```

Well, I learnt something new today. You can't mix :FOR and :AFTER or :BEFORE on the same node no matter the symbol they refers (:AFTER something and then :FOR something else). It will be fixed on the next release, currently unscheduled however.

Tanks for the heads up!
